Record Oilseed and Palm Oil Production in

Asia and Oceania Fueled by Continued Growth in Palm Oil

* Other = Copra, Palm Kernel, Sunflowerseed

Asia along with the archipelago nations off the coast of Southeast Asia will produce an estimated 110 million tons of oilseeds plus palm oil in 1999/00 out of 301 million produced world-wide. Asia and Oceania do not produce vegetable oil crops at a level commensurate with their population, but do produce at a level comparable to their percentage of gross world product. Oilseed plus palm oil output in Asia and Oceania is forecast to be at a record in 1999/00, in line with trend and up because of generally favorable weather thus far during the year; and output is forecast to be up 43 percent over the last 10 years. Peanuts, soybeans, and cottonseed are the largest oilseed crops in Asia and Oceania, but palm oil output has increased dramatically over the last decade, almost reaching the level of cottonseed for which output is up only a small amount.

This report uses information from the Foreign Agricultural Services' global network of agricultural attaches and counselors; official statistics of foreign governments and other foreign source materials; and the results of economic and satellite imagery analysis. Estimates of foreign area, yield and production are from the Production Estimates and Crop Assessment Division, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committees. Estimates of U.S. area, yield and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-353), August 12, 1999.

This report was prepared by the Production Estimates and Crop Assessment Division, FAS/USDA. The next issue of World Agricultural Production will be released after 3:00 p.m. Eastern time on September 13, 1999.

PRODUCTION BRIEFS

CHINA: DROUGHT CUTS CORN YIELD

Corn production for 1999/2000 in China is reduced by 4.0 million tons this month to 128.0 million tons due to lower estimated yield in most of China's corn-producing provinces. The weather was generally favorable for corn in Heilongjiang during July, but dryness was a problem in parts of Liaoning and Jilin. Dry and hot weather also affected the North China Plain in July, particularly Shandong, southern Henan, and northern Anhui and Jiangsu provinces, but rainfall in Hebei and Shanxi was more favorable. The weather has been mostly dry and warm in early August as the crop moves from tasseling to filling stage. Conditions have been generally favorable for early corn in southern China, although heavy rain in central China may have caused some flood losses.

Corn area is estimated at 25.3 million hectares, unchanged from last month and up slightly from last year. Area is reported down in the corn-surplus provinces of Liaoning and Jilin, but area likely increased on the North China Plain (shifted from cotton) and in southern China, where farmers reportedly switched from early rice to corn. The increased area in the south will have a small impact on total production because yields in the region are traditionally lower than the national average.

RUSSIA: DROUGHT, LOCUSTS THREATEN WHEAT AND COARSE GRAIN OUTPUT

Estimated wheat production in Russia for 1999/2000 is reduced this month from 31.5 million tons to 31.0 million (26.9 million last year); barley is down from 12.0 million tons to 11.5 (9.8) million; oats are down from 5.0

million tons to 4.5 (4.6) million; and corn is down from 1.8 million tons to 1.0 (0.8) million. Total-grain production including pulses is estimated at 54.7 million tons, up 7.0 million from last year, but 15.2 million below the 5-year average and 31.9 million below the 10-year average. Harvest has begun in southern Russia, with high wheat yield reported in Krasnodar Kray, in the North Caucasus region. Krasnodar grains benefitted from generally favorable weather throughout the growing season -- unlike the rest of the North Caucasus and Volga Valley -- and subsequent yield is expected to drop as harvest advances into more drought-stricken regions.

Russian agricultural officials indicate that the 1999 grain harvest could be reduced by 4 million tons because of locust damage. According to the Ministry of Agriculture, the threat is greatest in regions adjacent to Kazakhstan, including the Volga Valley, Urals, North Caucasus, and Western Siberia. The problem reportedly has been exacerbated by hot, dry weather in some areas, which has caused the locusts to travel farther than usual in search of food. No quantitative assessment of damage has been released, however, and assessment of actual damage is difficult.

CHINA: WHEAT OUTPUT REVISED HIGHER

China's 1999/2000 wheat crop is estimated at 115.0 million tons, up 3.0 million from last month and 5.0 million above last year's weather-reduced crop. Chinese officials report that summer grain output (85 to 90 percent winter wheat) reached a near-record 118.5 million tons despite a small drop in planted area. The weather was unusually dry during the fall and winter, but favorable late-season

rainfall and good harvest weather boosted winter wheat prospects. Spring wheat production is expected to decline, as farmers responded to government policy which discouraged the planting of low-quality grains with a 10-percent drop in spring wheat planted area. Planting was delayed in parts of the Northeast and Inner Mongolia by cool spring weather, but the weather was generally favorable during the growing season. The spring wheat crop is now maturing and harvesting will begin in August.

UKRAINE: HEAT AND DRYNESS IN EAST REDUCE HARVEST PROSPECTS

Estimated wheat production in Ukraine for 1999/2000 is unchanged this month at 14.0 million tons (14.9 million last year), barley is down 1.1 million tons to 5.0 (5.9) million, and corn is down 1.4 million tons to 2.0 (2.3) million. Harvest was roughly 80 percent complete as of August 6, with yield running 8 percent below last year's level. Total-grain production including pulses is estimated at 24.7 million tons, down 2.1 million from last year and down 6.5 million from the 5-year average and down 13.1 million from the 10-year average. Weather has been consistently unfavorable for Ukraine grains this season: extremely dry sowing conditions last fall; two episodes of sub-freezing weather in early May; and, drought during June and July. Grains reportedly matured earlier than usual because of the drought and were simultaneously ripe throughout Ukraine. Much of the grain could not be harvested in a timely manner, however, due to machinery and fuel constraints. The harvest delays are expected to have a negative impact on both yield and quality.

KAZAKSTAN: WHEAT AREA LOWER THAN EXPECTED

According to Kazakhstan's Ministry of

Agriculture, 9.2 million hectares were sown to wheat this year, roughly 0.8 million less than earlier forecasts indicated. Because of the lower area, estimated wheat production is down 0.5 million tons to 6.5 million. Estimated spring wheat yield for 1999/2000 is roughly 10 percent above the average of the past five years because of above-average precipitation in the prime grain-growing zone. Locusts pose a threat to grain output this year. Although no official assessment of damage has been released, some local experts estimate that roughly 0.5 million hectares of wheat may be destroyed by insects.

BRAZIL: PRODUCTION ESTIMATES FOR WHEAT LOWERED, CORN RAISED

Brazil's 1999/2000 wheat production is estimated at 2.0 million tons, down 0.5 million from last month and 9 percent below last year. Harvested area is estimated at 1.3 million hectares, down 0.3 million from last month and 11 percent below last year. Indications are that farmers have shifted area from wheat to corn or fallow in response to higher overall production costs (seed, pesticides, and fertilizer) and tighter credit availability driven by the earlier devaluation of the Brazilian Real. Also, an 18-percent increase in government price subsidies for wheat proved inadequate to many farmers. Uncertainty about future prices, coupled with the risk of crop losses due to heavy rains at harvesting are contributing factors towards the decline in wheat area. Harvesting typically begins in September.

The corn crop (October - December planting) is forecast at 34.0 million tons, up 1.0 million from last month and up 5 percent from 1998/99. Harvested area is estimated slightly higher this month to 12.5 million hectares. As mentioned above, the increase in corn area is attributed to lower projected wheat plantings. Yield is revised higher to 2.72 tons per hectare

as the additional area will be in the higher producing states.

EU-15: GRAIN PRODUCTION LOWERED DUE TO UNFAVORABLE WEATHER

Total EU-15 grain production (excluding rice) is estimated at 198.7 million tons for 1999/2000, down 5 percent from 208.5 million in 1998/99. Wheat production is estimated at 96.5 million tons, down 1.1 million tons from last month and down 7 percent from last season's record level. Coarse grain production is forecast at 102.2 million tons, down 0.5 million tons from last month and down 3 percent from last season. In Germany, this month's reductions are due to unfavorable weather during the planting season which made producers plant less area to grains. The German wheat estimate fell from 19.5 million tons to 19.0 million and coarse grains dropped from 25.0 million tons to 24.2 million. Most of the decrease in coarse grains are in barley and rye output. Italy's wheat production estimate decreased from 7.9 million tons to 7.3 million this month. Drought in the beginning of the growing season followed by excessive rain in late June lowered the yields of both soft and durum wheat. The Italian coarse grains estimate actually increased 5 percent to 11.9 million tons, up 13 percent from 1998/99 due to favorable weather at crucial times during the growing season, with most of the increase in corn production.

VIETNAM: RECORD RICE CROP EXPECTED IN 1999/2000

Rice production in Vietnam for 1999/2000 is forecast at a record 19.4 million tons, up 3 percent from last month and up marginally from last year. The forecast is revised higher based on an increase for the 1998/99 crop. The just completed 1998/99 summer-autumn

crop surpassed the previous record for this crop, in part because of the early onset of the rainy season. Rice crops in Vietnam have been steadily trending upward for the past decade. Vietnam has three rice crops a year: the first crop of the season is the 10th month (rainy season) crop, followed by the winter-spring crop, and then the summer-autumn crop. As of mid July, the 10th month crop is already half transplanted in the north, where the early onset of this year's rainy season has spurred development. The 10th month crop is the major rice crop of the year in the north.

INDIA: RICE PRODUCTION REVISED HIGHER

The Government of India recently released data for the 1998/99 rice crop indicating that area was larger than previously estimated. The 1998/99 rice area is now estimated to have been 44.5 million hectares resulting in a 84.7 million ton crop, up 740,000 tons from last month. For 1999/2000, area is forecast at 44.5 million hectares based on last season's upward revision in area. This is a 1.5 million hectare increase month-to-month, but virtually unchanged from 1998/99. Production is forecast at 84.5 million tons, up 0.5 million from last month, but down slightly from last season's record crop. The monsoon season so far has provided good coverage in the rice growing regions.

INDIA: COARSE GRAIN AREA AND PRODUCTION REVISED

Coarse grain production estimates for India were reassessed based on recently released data from the Government of India. The 1999/2000 barley production is now estimated at 1.5 million tons, sorghum 10.0 million, and corn 11.0 million. A reduction in barley area during the past winter growing

season resulted in 0.2 million tons less than the previous estimate of 1.7 million tons. In addition, less area is expected to have been planted to sorghum this kharif season, thus output is forecast to decrease 1.0 million tons. While the corn area forecast remains the same as last month, yield is increased slightly with sufficient monsoon rains occurring in the corn growing regions: production is estimated to increase 0.5 million tons.

ARGENTINA: WHEAT PRODUCTION FORECAST HIGHER

Argentina's wheat production for 1999/2000 is forecast at 12.3 million tons, up 0.3 million from last month and 14 percent above last season. Harvested area is forecast to increase to 5.3 million hectares, up 2 percent from last month and 11 percent from last season. Area is revised higher based on the latest planting intentions reported by the Argentine Agricultural Secretariat. Planting is progressing well with 90 percent of the intended planted area seeded as of August 6. Excessive moisture has delayed planting in a few areas of La Pampa, Cordoba and Entre Rios; however, planting and early growing conditions are reported to be generally favorable.

EASTERN EUROPE: WET WEATHER DAMAGES WHEAT AND BARLEY

While seasonal weather has favored crop development in Poland, persistent rains and damaging hail in July and early August has further diminished harvest prospects for winter grains throughout most of Eastern Europe. Standing water has contributed to an outbreak of fusarium fungus, excessive weed growth, and has prevented machinery from working the fields at the optimal time. Additionally, crop quality is expected to suffer from low-quality seed, lack of fertilizer, and low pesticide

usage. Low gluten content in the grain, induced from the season's excessive moisture, ensures that much of this year's wheat will not make bread standards and must be sold as feed. Barley production in Romania is estimated to drop from 1.2 million tons last month to 0.8 million. The waterlogged country of Hungary is estimated to produce only 2.8 million tons of wheat during 1999/2000, down 0.3 million from last month and 2.2 million from the 1998/1999 harvested crop of 5.0 million. In the Czech Republic, area is revised lower for barley and higher for wheat this month. With yield nearly unchanged, barley output is estimated down 0.5 million tons to 2.1 million, while wheat is adjusted higher by 0.3 million tons to 4.0 million.

CHINA: BUMPER RAPESEED CROP FOR 1999/2000

China's 1999/2000 rapeseed crop is estimated at 9.7 million tons, down 0.3 million from last month, but up 17 percent from last year and the second-largest output on record. Area is estimated at a record 7.2 million hectares, and the estimated yield of 1.35 tons per hectare is close to the 5-year average. The August revision is based on official Chinese Government estimates of the 1999/2000 summer rapeseed crop, which accounts for about 95 percent of the total harvest. Planted area increased by more than 3 percent over last year to 6.9 million hectares, and production increased by more than 18 percent due to higher estimated yield. Although the weather was unusually dry during the winter and early spring, the conditions were favorable for reproduction, filling, and harvest.

CHINA: COTTON PRODUCTION DECLINES DUE TO AREA DROP

Cotton production for 1999/2000 is estimated

at 19 million bales (4.1 million tons), down 0.5 million from last month and down 1.7 million from last year due to lower estimated planted area. According to Chinese officials, cotton area has fallen, in response to government policies designed to reduce cotton output, especially lower procurement prices. The Government has strongly encouraged farmers to reduce planted area, especially in the Yangtze River valley and the North China Plain, to reduce production, lower stocks, cut government expenses, and improve cotton quality.

Cotton yield for 1999/2000 is forecast at 1009 Kg/Ha, relatively unchanged from last year's

near-record yield. The weather has not been a serious concern for cotton so far this year. The southern cotton provinces of Hunan and Jiangxi have been wetter than normal, but flooding has been minor compared to last year. In central China (Hubei, Anhui, and Jiangsu) excessive rainfall in June and July was followed by mostly dry and warm weather. The North China Plain has experienced periods of drought this summer, especially in Shandong Province, but recent rainfall has improved moisture levels for cotton in Hebei and Henan. Conditions in western provinces are near-normal.

1/ Includes wheat, coarse grains, and rice (milled) shown above.

2/ Includes soybean, cottonseed, peanut (inshell), sunflowerseed, rapeseed, and palm kernel are added to world totals.

Note: Entries of 0.0 indicate no reported or insignificant production.

August 1999

TABLE 19

The table below presents a 18-year record of the differences between the August projection and the final estimate. Using world wheat production as an example, changes between the August projection and the final estimate have averaged 12.9 million tons (2.4 percent) and ranged from -32.1 to 19.5 million tons. The August projection has been below the final 9 times and above the final 9 times.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.

WORLD AGRICULTURAL WEATHER HIGHLIGHTS

1 - UNITED STATES

A late July heat wave brought the highest temperatures in 4 to 11 years across much of the Midwest and Ohio Valley, stressing livestock, pastures, and reproductive summer crops. Record-setting heat overspread the Southeast toward month's end, negating the benefits of late June and early July rainfall that had stabilized crop conditions. In the Mid-Atlantic region, where 13-month moisture deficits topped 18 inches in a few areas, the focus of extreme drought remained centered on an area that included eastern West Virginia, northern Virginia, and Maryland. Drought also intensified across the interior Northwest, where moisture deficits mounted in most areas for the fifth consecutive month. In contrast, a banner start to the summer rainy season across the Southwest improved water supplies and eased long-term drought, but caused localized flooding. In California, below-normal temperatures slowed crop development.

2 - CANADA

Across the Prairies, crop development ranges from 1-4 weeks behind schedule. An unusual cold snap in mid-July reportedly caused some damage to spring grains and oilseeds in the west. Sunny, periodically warm weather since then has improved prospects for haying and spring crop development. In eastern Canada, early-August rainfall brought some relief to corn and soybeans but hampered wheat harvests.

3 - SOUTH AMERICA

In central Argentina, mostly near- to above-normal July rainfall increased topsoil moisture for winter wheat germination. Additional rainfall is needed to eliminate scattered dry pockets in the region. In southern Brazil, near- to above-normal rainfall continued to favor vegetative to reproductive winter wheat. Seasonably dry weather aided coffee and citrus harvesting in Sao Paulo and Minas Gerais.

4 - EUROPE

Relatively dry weather in July promoted rapid winter grain harvesting from England and northern France eastward through Poland. Since August 1, however, showers have slowed harvesting. Near- to slightly above-normal rainfall benefited developing spring-sown crops from northern Spain and central and southern France eastward through Austria. Frequent rains in Hungary, Slovakia, and the Balkans repeatedly interrupted winter grain harvesting and caused localized flooding.

7 - SOUTH ASIA

The southwest monsoon progressed well during the first half of July, providing most grain, oilseed, cotton, and sugarcane areas with abundant moisture. Since mid-July, however, below-normal rainfall has plagued important oilseed and cotton areas of west-central India, as well as summer crop areas of the southern interior. In the east, flooding has shifted from heavily irrigated locations in Bangladesh and eastern India to India's rainfed rice areas.

8 - EASTERN ASIA

Mostly dry weather from early July to early August reduced rainfed summer crop yield prospects across the North China Plain and southern Manchuria. Near-normal July rainfall favored summer crops and spring wheat in northern Manchuria. Drier weather eased excessive wetness along the northern Yangtze Valley, but above-normal July rainfall likely caused flooding across the southern portions of the Valley. Three tropical systems struck the Korean Peninsula during late July and early August, causing flooding and possible rice damage. In northern Japan, warm, wet weather during July provided average, but not ideal, conditions for rice development.

9 - SOUTHEAST ASIA

Near-normal July rainfall increased moisture supplies for corn and rice across most of Thailand, Vietnam, and the Philippines. Below-normal showers in northern Thailand and south-central Vietnam, however, reduced irrigation supplies. Excessive showers in early August caused flooding in western Luzon, Philippines. Near- to above-normal rainfall favored oil palm in peninsular Malaysia and seasonable showers favored second-crop rice in Java, Indonesia.

10 - AUSTRALIA

Scattered showers in the western and southeastern winter grain belts have maintained adequate topsoil moisture levels for early wheat and barley development. Cool, dry conditions in Queensland and New South Wales have restricted the vegetative development of winter crops. Along the coast, periods of heavy rain during July kept unharvested sugarcane unfavorably wet.

USDA/OCE - World Agricultural Outlook Board
Joint Agricultural Weather Facility

*(More details are available in the Weekly Weather and Crop Bulletin.
Subscription information may be obtained by calling (202) 720-7917.)*

5 - FSU-WESTERN

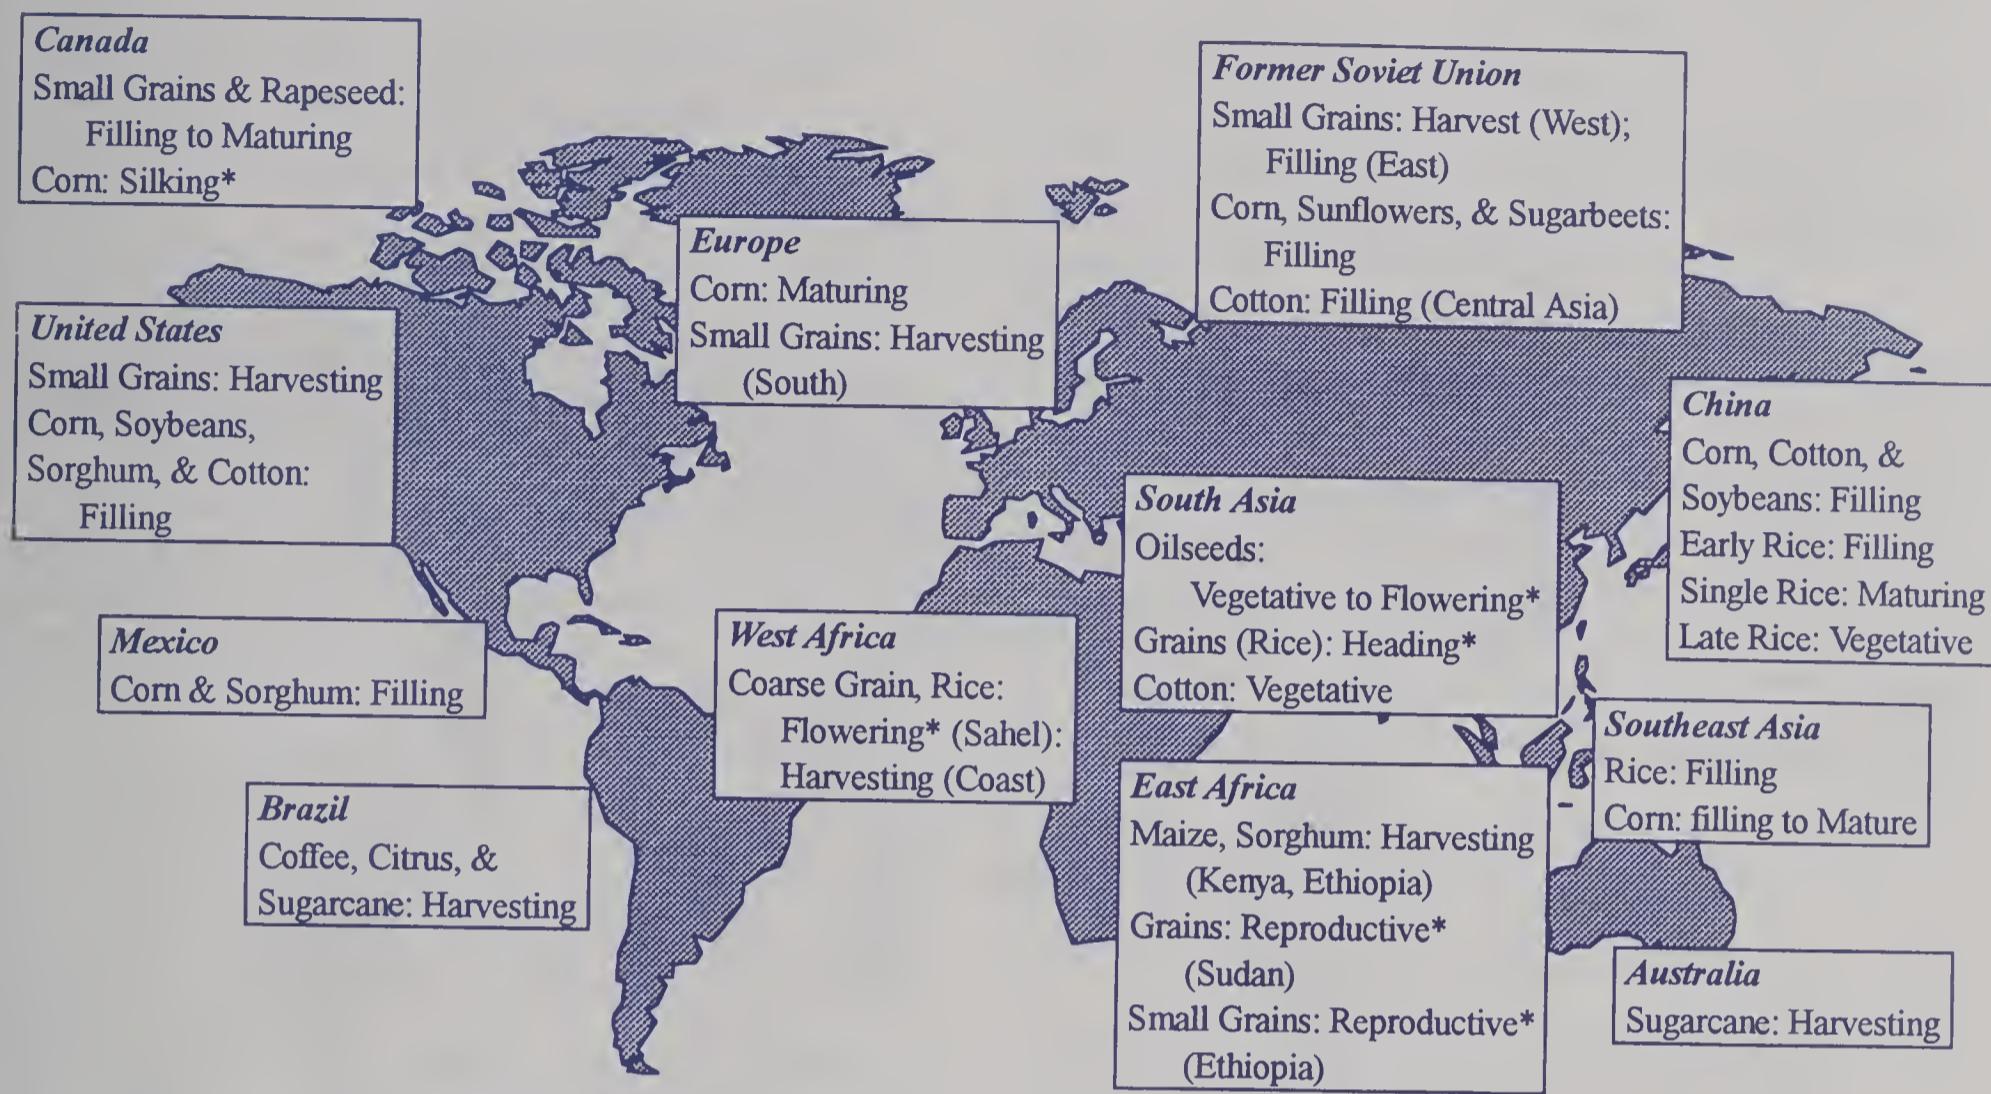

In July, below-normal rainfall and oppressive heat in southern Russia and Ukraine favored winter grain harvesting but reduced yield prospects for filling spring grains and reproductive corn and sunflowers. Farther north, cool, wet weather in northern Russia hampered winter grain harvesting. In early August, although cooler weather and scattered showers eased heat stress on summer crops in Ukraine and southern Russia, hot weather recently returned to these areas.

6 - FSU-NEWLANDS

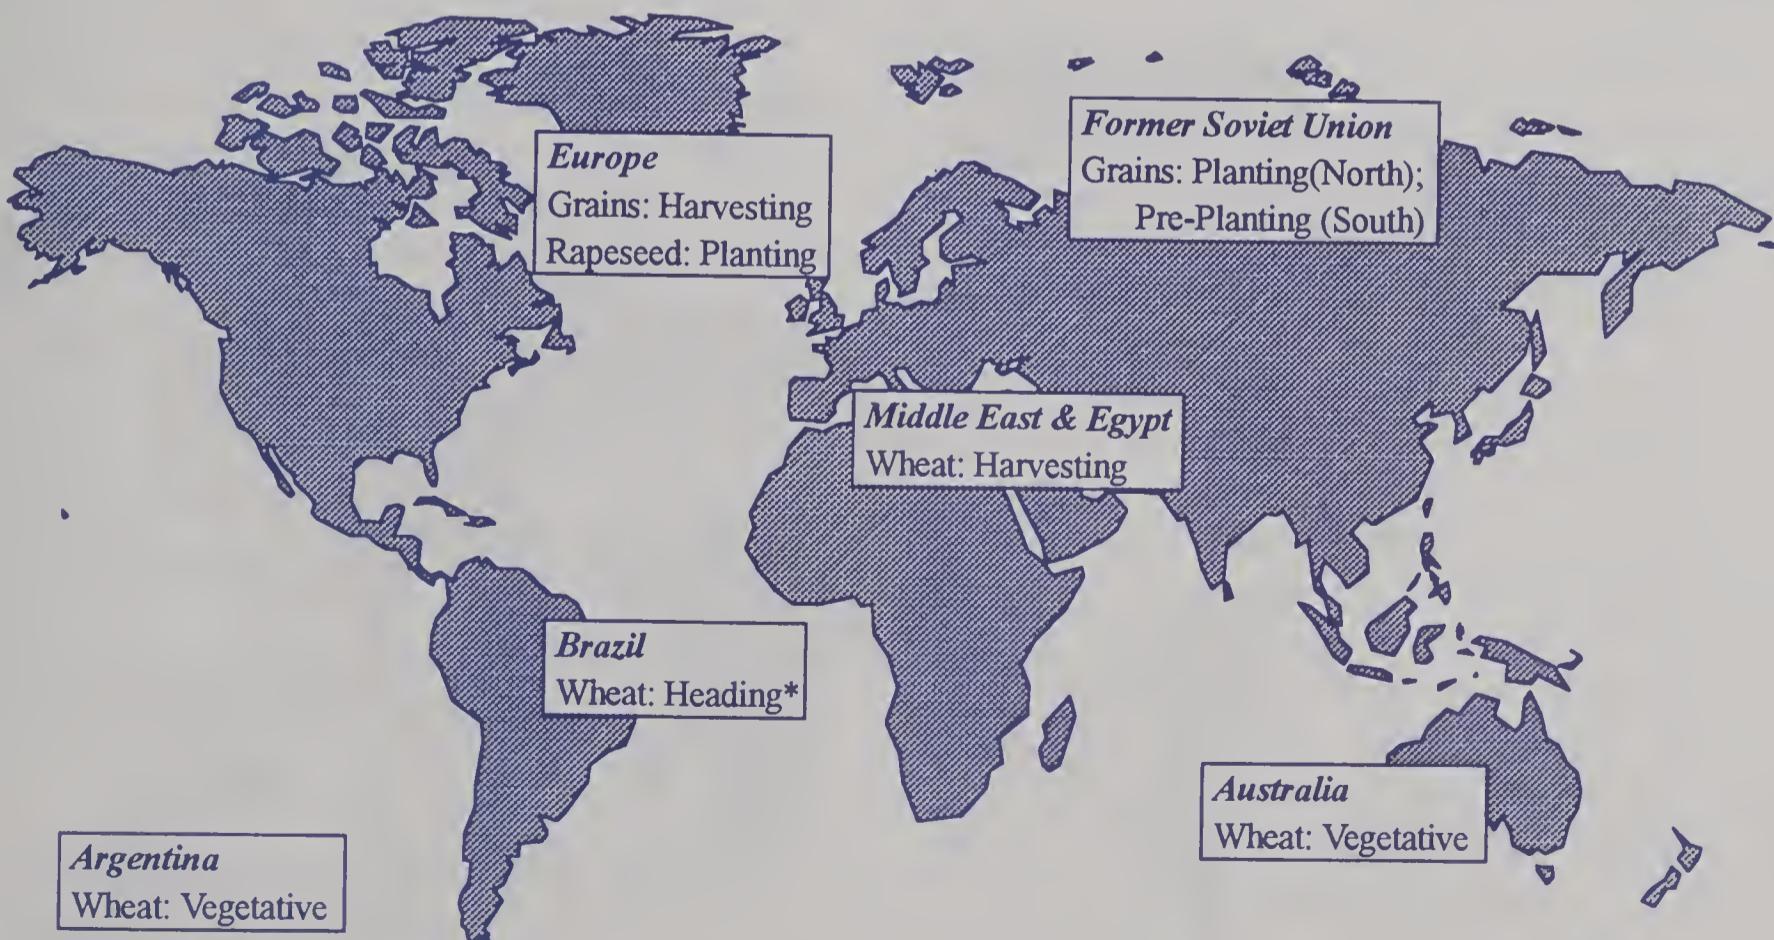

In Russia, adequate moisture in July favored spring grains in the northern Urals. Drier weather prevailed over spring grain areas in Western Siberia. In Kazakhstan, hot, dry weather overspread the west in July, accelerating spring grain development. Farther east in major spring grain producing areas of north-central Kazakhstan, weather conditions remained favorable for crop development.

WEATHER BRIEFS

MEXICO: SHOWERS FAVOR CORN CROP; NORTHEAST REMAINS TOO DRY

During June 1999, the "rainy season" began on time, providing needed moisture for corn planting. Rainfall was near to above normal across the main corn belt, above normal in northern and north-central Mexico, and slightly below normal in the northeast. During the first 10 days of July 1999, widespread showers provided adequate moisture for vegetative corn across the Southern Plateau corn belt. Beneficial showers reached into north-central Mexico (Durango), the northeast (Tamaulipas and Nuevo Leon), and the northwest (Sonora), increasing reservoir supplies. Drier weather prevailed in the extreme north. Tropical showers possibly caused some flooding in southern Mexico. Widespread showers increased moisture supplies across the Yucatan Peninsula. The week of July 11 - 17 was highlighted by lighter than normal showers in the Southern Plateau. Moisture levels remained adequate to favor vegetative corn grown there. Also, showers boosted reservoir levels in northwestern Mexico and showers continued to improve moisture supplies in the Yucatan Peninsula. From July 18 - 31, showers were widespread and seasonal across the Southern Plateau corn belt, benefitting vegetative corn. While monsoonal showers continued to water the northwest, only light showers fell across the dry northeast.

FORMER SOVIET UNION: BENEFICIAL RAIN FOR SPRING GRAIN IN NEW LANDS

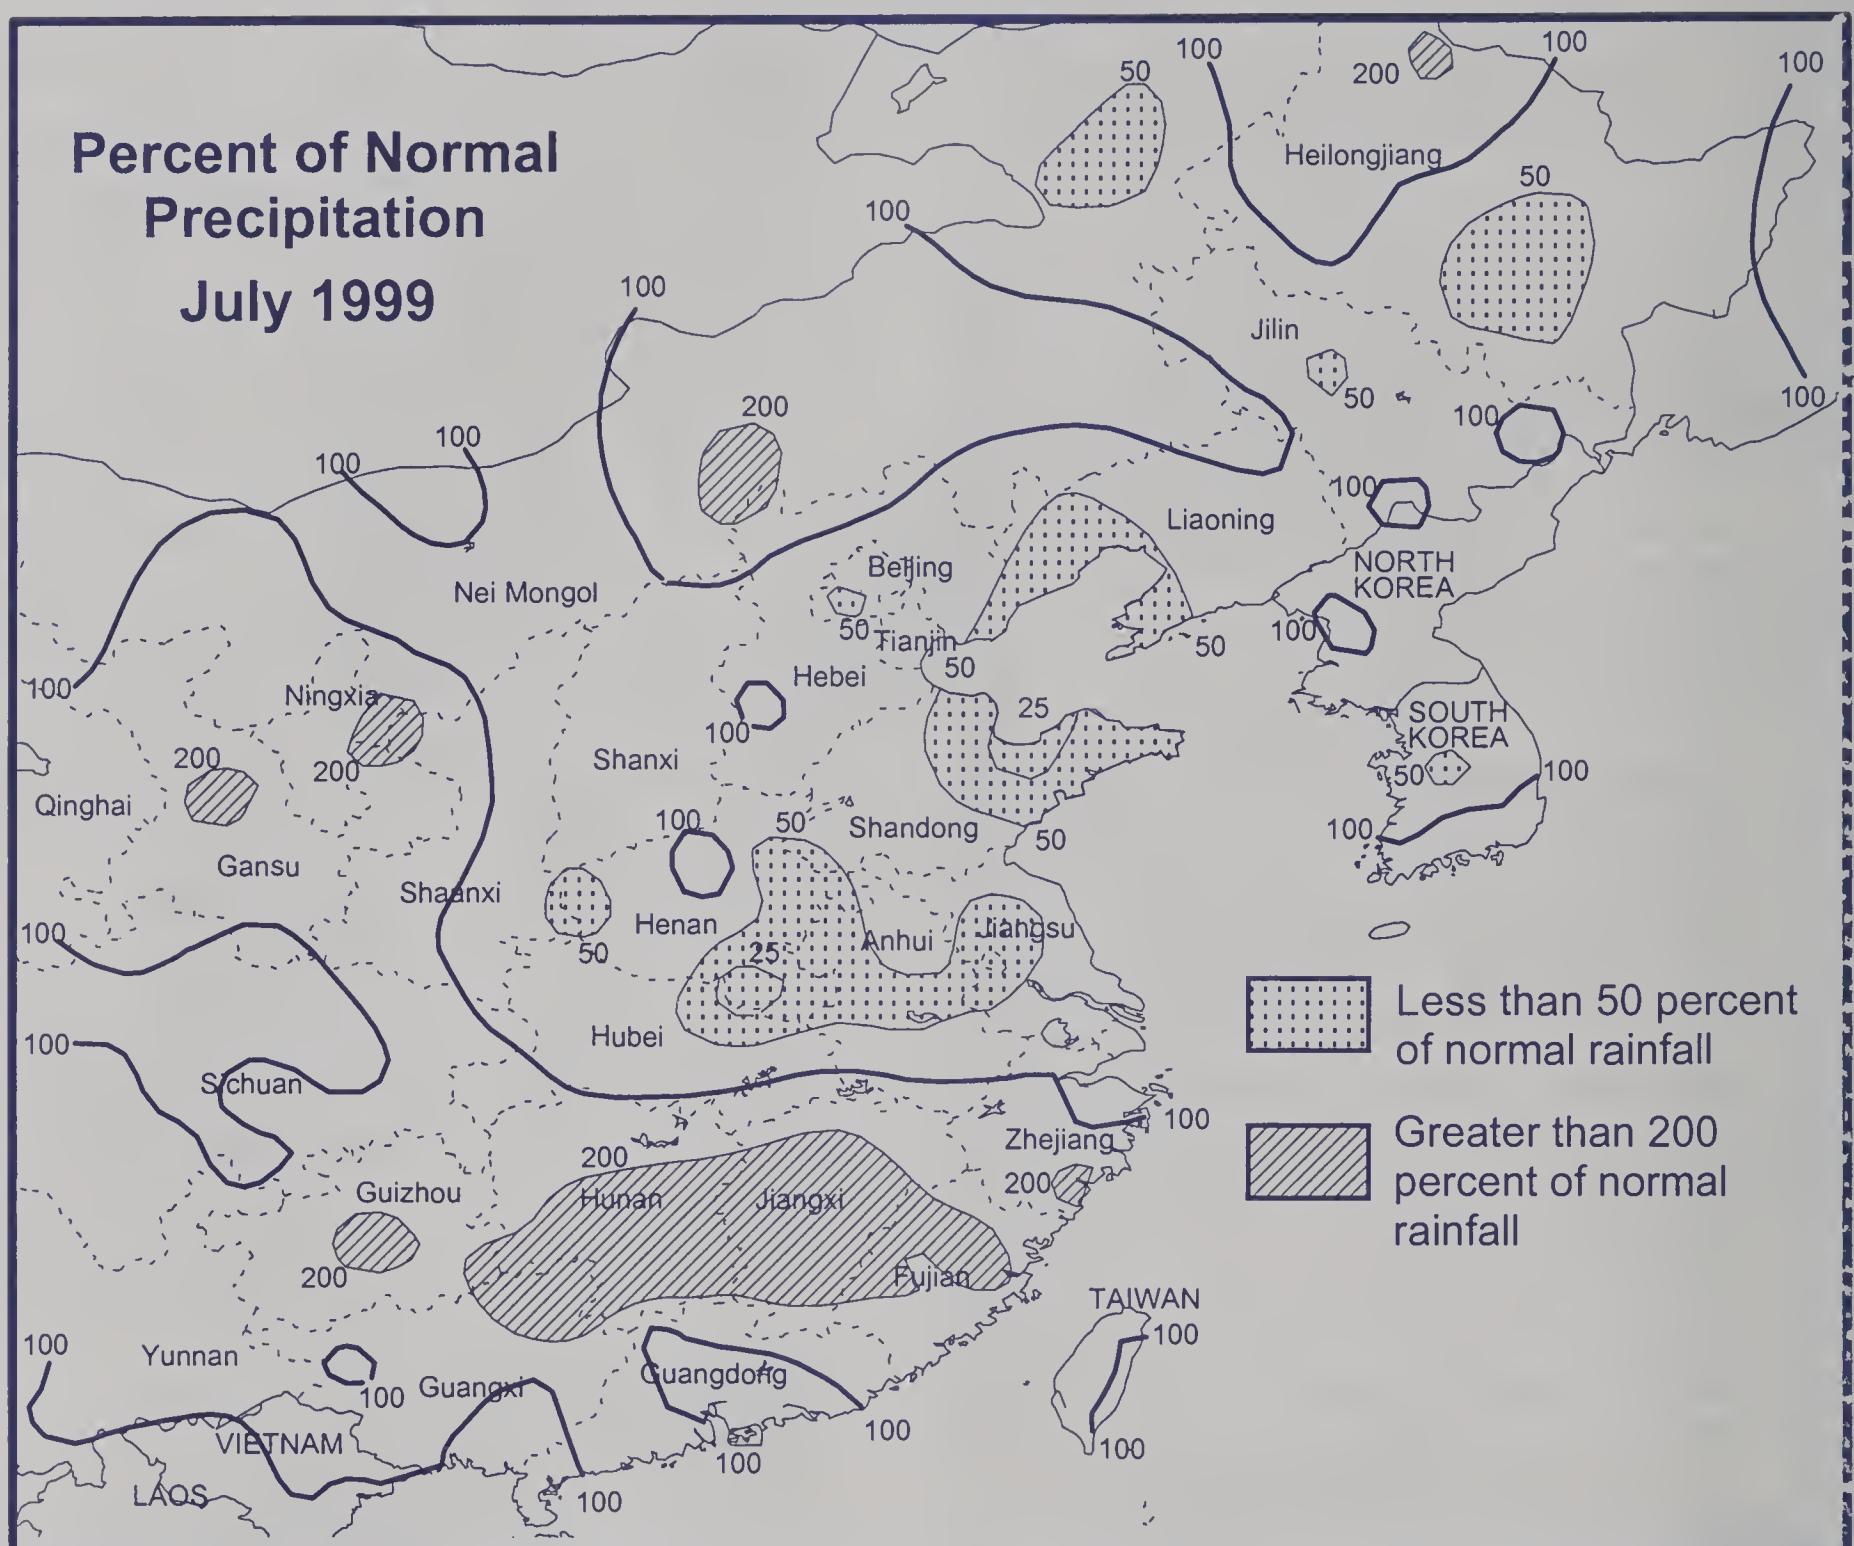

Spring grains in the New Lands (Kazakstan, the Urals, Western Siberia) benefitted from

generally favorable weather during July. Precipitation was near to above normal for the second consecutive month in major grain-producing areas, except for parts of Western Siberia where conditions had become slightly dry by the end of the month. Temperatures averaged above normal in July, and climbed sharply late in the month as the crop was advancing through the grain-fill stage. Meanwhile, the threat of locust damage has raised alarms in Russia and Kazakstan. Agricultural officials indicate that 3 to 5 percent of total crop area could be damaged by locusts, but no damage-assessment reports have been released in either country.

INDIA: MONSOON ACTIVITY CONTINUED NORMAL

During the week of July 18 - 24, 1999, widespread, locally heavy rain covered primary oilseed areas of west-central India. The moisture improved prospects for groundnut and soybean establishment while allowing a resumption of planting in the driest areas. Beneficial rains also developed over the rice and cotton areas of northern India. However, during the week of July 25 - 31, monsoon activity diminished over southern, northwestern, and eastern sections of the region. As a result, unseasonably dry weather (rainfall totaling 10 millimeters or less) dominated important oilseed, cotton, grain, and sugarcane areas from Pakistan southward to India's southern tip. The heart of the soybean belt (western Madhya Pradesh) continued to receive timely, albeit below-normal rainfall. Unfortunately, the drying trend became entrenched over Gujarat's groundnut basin and continued into early August. In contrast, heavy rain returned to the eastern rice belt in early August, spurring localized flooding.

CHINA

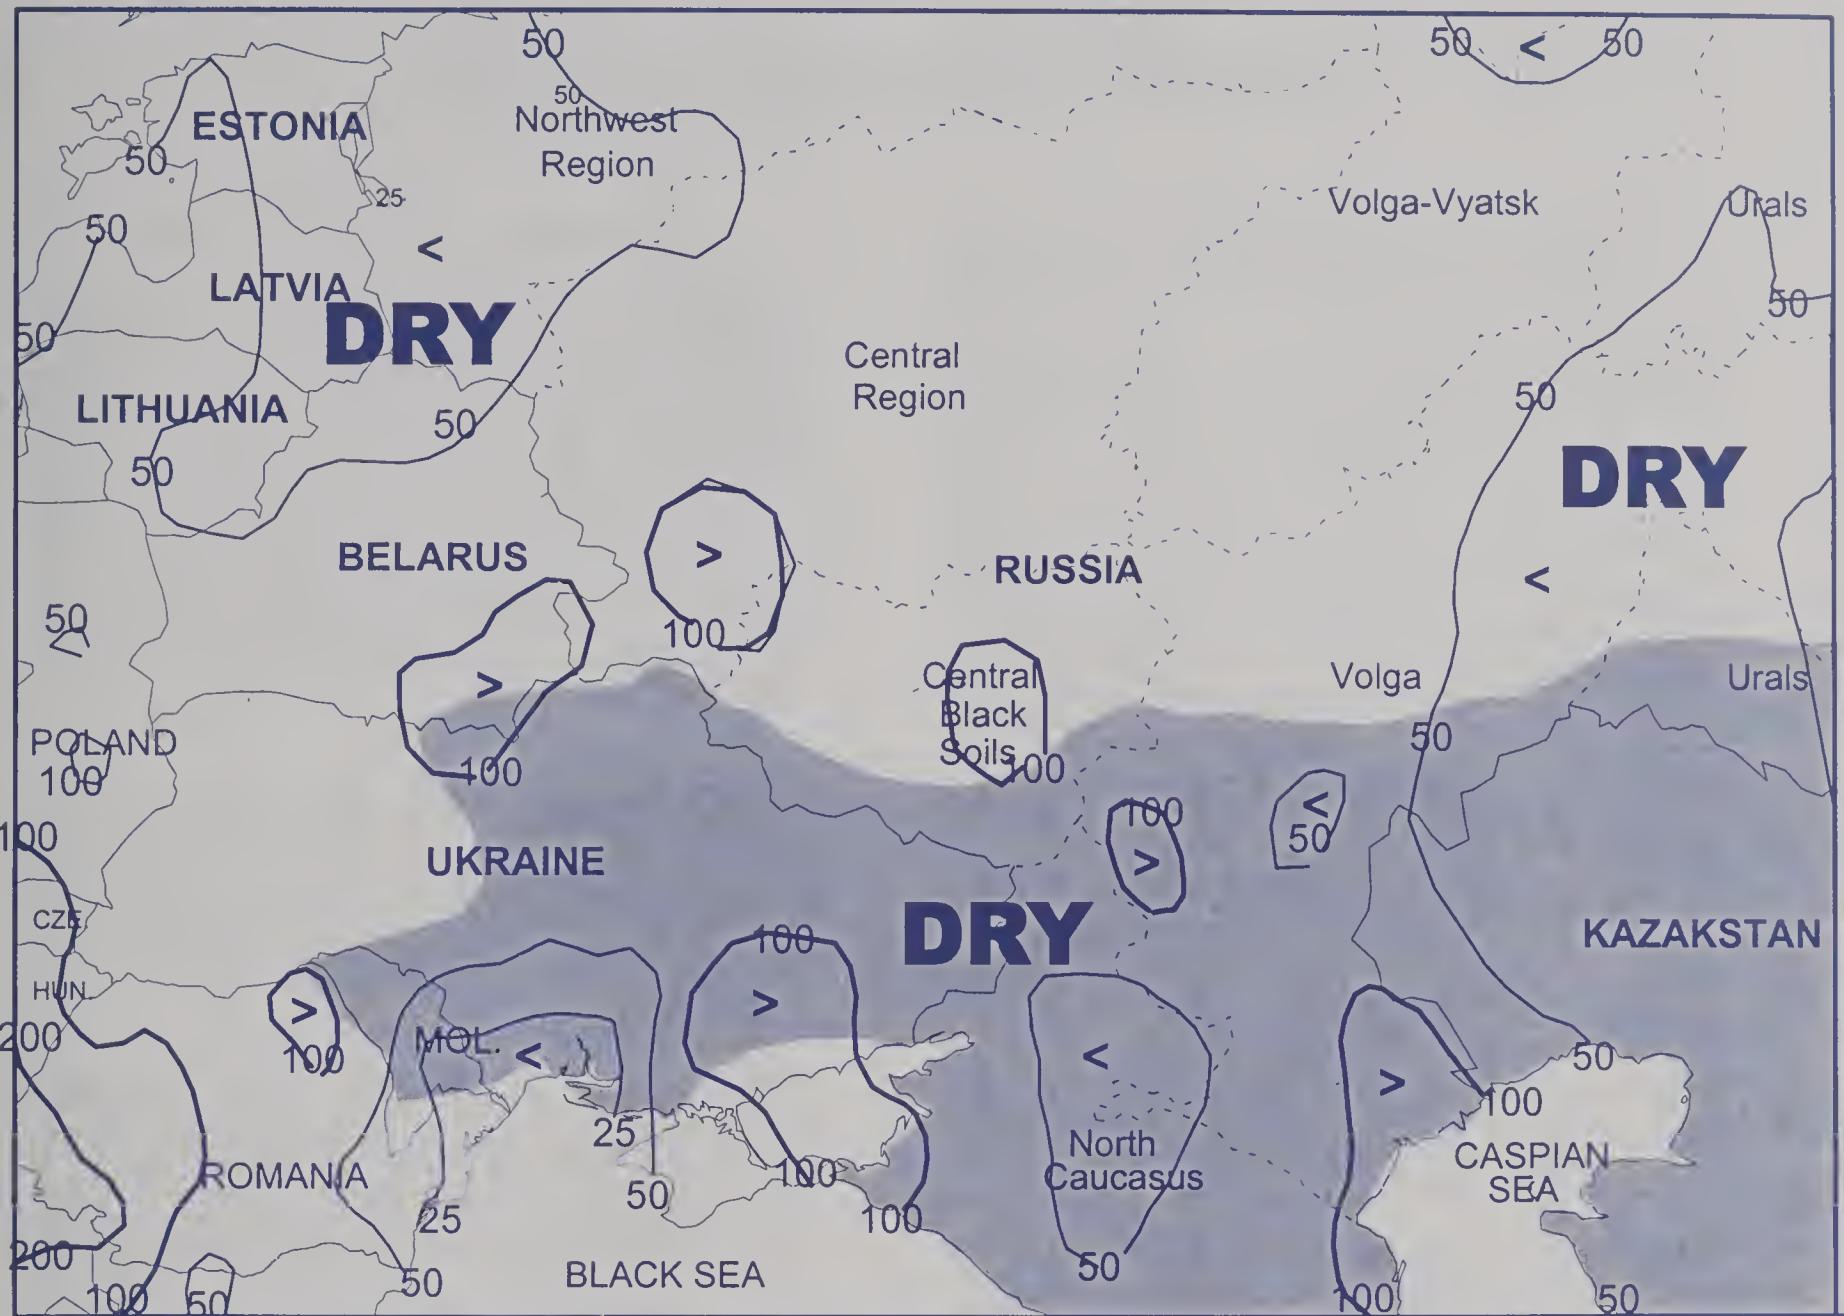

WEATHER AND CROP HIGHLIGHTS

AUGUST 12, 1999

- Mostly dry weather from early July to early August reduced rainfed summer crop prospects across the North China Plain and southern Manchuria. Near normal July temperatures kept crop water use to average levels. Near-normal July rainfall favored summer crops and spring wheat in northern Manchuria.
- Drier weather eased excessive wetness along the northern Yangtze Valley, but above-normal July rainfall likely caused flooding across the southern portions of the Valley. The wet weather slowed early double-rice harvesting and late double-rice transplanting.

FORMER SOVIET UNION (WESTERN)

(NOAA/USDA Joint Agricultural Weather Facility)

Percent of Normal Precipitation for July 1999

Area where oppressive heat and dryness in July placed moderate to severe stress on summer crops.

Based on preliminary reports.

WEATHER AND CROP HIGHLIGHTS

August 12, 1999

- o In July, oppressive heat and dryness overspread major summer crop growing areas of southern Russia and the eastern two-thirds of Ukraine, placing moderate to severe stress on corn and sunflowers advancing through reproduction.
- o In early August, scattered showers and cooler weather stabilized conditions for summer crops in Ukraine and southern Russia. However, hot weather recently returned to these areas, increasing heat stress on filling crops.

FEATURE COMMODITY ARTICLES

ASIA AND OCEANIA OILSEED PRODUCTION

Asia along with Oceania will produce an estimated 110 million tons of oilseeds plus palm oil in 1999/2000 out of 301 million produced world-wide. Asia and Oceania do not produce vegetable oil crops at a level commensurate with their population, but do produce at a level comparable to their percentage of gross world product (GWP). Asia and Oceania produce 37 percent of the world's oilseeds plus palm oil while they have 58 percent of the world's 5.9 billion people and while they produce 35 percent of the world's \$38 trillion GWP. By contrast, The United States produces 30 percent of the world's oilseeds while it has 5 percent of the population and produces 21 percent of GWP. (Population and GWP data are taken from the World Fact Book, CIA, 1998; GWP data are on an adjusted purchasing power basis.) Oilseed plus palm oil output in Asia and Oceania is forecast to be at a record in 1999/2000, in line with trend and up because of generally favorable weather thus far during the year; and output is forecast to be up 42 percent over the last 10 years.

East Asia: Within Asia, East Asia (China, Japan, North and South Korea, Taiwan and Mongolia) is the largest producing region. East Asia is forecast to produce 44.3 million tons of oilseeds in 1999/2000. This total includes 13.8 million tons of soybeans, 12.1 million tons of peanuts, 9.7 million tons of rapeseed, and lesser amounts of cottonseed and sunflowerseed, but no tropical oilseeds. East Asia has a temperate to subtropical climate.

China is by far the largest producer of oilseeds in the region, and the weather has been largely favorable for oilseeds this year. The rapeseed

crop did not suffer from freeze damage as it did in 1998, and a bumper crop is forecast. Peanut area and production are expected to reach record levels in 1999. An inefficient marketing and transportation system in northeast China has led to a decline in soybean area in the last two years as processors in central and southern China have shifted to using cheaper and higher quality imported soybeans.

Oilseed output in East Asia increased from 1989/90 through 1995/96 as liberalized economic policies were applied at the farm level in China. Output has been fairly flat since 1995/96.

South Asia: South Asia (India, Pakistan, Nepal, Bhutan, Bangladesh, and Sri-Lanka) is the second biggest producing region in Asia, and is dominated by Indian oilseed production. The South Asia climate encompasses a southern temperate zone in northern India to a northern tropical climate further south, and produces all major types of oilseeds, but very little palm oil. It is forecast to produce 8.5 million tons of cottonseed, 8.2 million tons of peanuts, and 6.6 million tons of rapeseed in 1999/2000.

A tariff reduction in India and low world oilseed prices have reduced incentives to produce this year, but strong demand will keep area harvested at levels similar to last year. Inconsistent rainfall since June is causing concern in some areas, but generally the outlook for the crop is good. Pakistan cottonseed production is expected to be up on slightly higher area and yield.

Output in South Asia is forecast at 31.6

million tons for 1999/2000. Output over the past decade has increased due to a larger harvested area and rising yields. Higher demand for oilseeds plus palm oil in the region corresponds with higher incomes and higher per capita consumption.

Oceania: Oceania (Malaysia, Indonesia, Philippines, Papua New Guinea, Brunei, and Singapore) is a large producer and exporter of tropical oils. In 1999/2000 it is forecast to produce 17.0 million tons of palm oil, 5.0 million tons of palm kernels, 3.9 million tons of copra. In addition, it is forecast to produce about 1 million tons each of peanuts and soybeans.

Output of palm oil and copra dropped sharply in Oceania in 1997/98 as a result of the El Nino related drought of 1997 which affected virtually the entire region. Palm oil output recovered in 1998/99, and copra output is expected to recover in 1999/2000. Total oilseeds plus palm oil production is forecast at a record 28.2 million tons in 1999/2000, up from the previous record 26.0 million set in 1996/97.

Over the past 10 years, expansion of palm oil production has been dramatic as output in Oceania has nearly doubled. Large investments in new plantations have occurred in Malaysia, Indonesia, and Papua New Guinea, and expansion is expected to continue. Oceania is very dependent on exports to maintain its palm oil output. The European Union, China, India, and Pakistan are four of its biggest markets, taking over 1 million tons per year each in recent years. Output of other oilseeds in Oceania has remained fairly constant during the past 10 years. The Philippines and Indonesia continue to be major producers of copra and suppliers of coconut oil to international markets.

Central Asia: Central Asia (Kazakhstan, Uzbekistan, Kyrgyzstan, Turkmenistan,

Tajikistan, Afghanistan, and Iran) is an important producer of cottonseed. Of the 3.5 million tons, of oilseeds it is forecast to produce in 1999/2000, 3.2 million will be cottonseed. Central Asia has an arid temperate climate and is very dependent on irrigation for the production of oilseeds.

In Uzbekistan, cool wet weather caused oilseed output to decline in 1998/99, but output in 1999/2000 should rebound to near the 1997/98 level of 0.27 million tons, assuming normal weather from here on. A drought during the spring and early summer in Iran caused concern for crops there, but rains in the last few weeks have alleviated much of the worry.

Central Asian oilseed output is down 33 percent from 5.2 million tons in 1989/90. The decline over the last 10 years is attributable to land being shifted into other crops, as well as occasional difficulties acquiring fertilizer and other inputs. A weakening in world demand for cotton since 1996/97 is also a factor.

Southeast Asia: Southeast Asia (Burma, Thailand, Laos, Vietnam, and Cambodia) is forecast to produce 2.7 million tons of oilseeds plus palm oil in 1999/2000. The region is mostly tropical, but not equatorial, and has a rainy season which runs from May through October in most areas. The region is forecast to produce in 1999/2000: 1.1 million tons of peanuts, 0.5 million tons of palm oil, and 0.5 million tons of soybeans. Southeast Asian production is insufficient for domestic use, and Southeast Asia is a net importer of palm oil and oilseeds, but a net exporter of peanuts.

Oilseed plus palm oil output is forecast 4 percent above last year, but down marginally from the record set in 1996/97. The increase is due to an increase in palm oil output in Thailand which has benefitted from good rainfall since late 1998. This increase follows the drought in late 1997 which reduced the

output level in 1998/99. Soybean production in Thailand is forecast down as the comparative advantage is favoring alternative crops such as corn and mung beans.

Oilseed plus palm oil output in Southeast Asia over the last decade has increased 20 percent. Output of palm oil has increased 186 percent as rubber production declined in southern

areas. Peanut output is up significantly in Burma and Vietnam, while copra production is up in Vietnam. Output of soybeans is down as trade barriers for their importation into Thailand have been reduced.

DURUM WHEAT PROSPECTS FOR 1999/2000

Durum wheat production for 1999/2000 in selected durum-producing countries is estimated to be lower than last year due to decreases for the United States, EU-15, and Canada, countries which in aggregate account for nearly sixty percent of the global production. Reductions are also expected in Syria, Turkey, Algeria, and Morocco. This season's major factor reducing crop size is unfavorable weather.

Approximately 5 percent of all wheat grown is durum. The 1999/2000 crop is forecast at 24.6 million tons, down 6.4 million or 21 percent from last year's record level. Harvested area is estimated at 14.6 million hectares, down 1.7 million from last season, while yield is forecast 4 percent below the 5-year average at 1.68 tons per hectare.

United States: Total U.S. durum wheat production for 1999/2000 is forecast at 3.1 million tons, down 19 percent from last season according to the National Agricultural Statistics Service's (NASS) *Crop Production* report, based on conditions as of August 1. Durum harvested area is estimated at 1.6 million hectares, up 5 percent from 1998/99. About 5 percent of all U.S. wheat grown this season is durum and about 75 percent of the U.S. durum is grown in North Dakota. North Dakota's crop was planted late due to excessive moisture and is about a week behind in development. Late July's hot, humid weather saw condition ratings fall to 60 percent good or better as of August 1. In addition, wheat midge and head scab are concerns in northeastern counties. North Dakota's output is projected to fall 12 percent as a decrease in yield more than offsets an increase in area. The first of the durum crops, harvested in Arizona and California (together accounting for 14 percent of total U.S. durum), have fallen 53 and 46 percent,

respectively, from 1998/99 due mainly to decreases in area.

EU-15: Durum wheat output is estimated at 7.6 million tons, down 1.1 million or 12 percent from last season. Year to year drops in production are forecast for Spain and Italy, while output is projected to rise in France and Greece. Total harvested area is forecast at 3.2 million hectares, up 1 percent from last season. The continued strength in durum area is attributed to the reduction in the EU set-aside rate. In Spain, drought in the prime durum areas of the south disrupted planting and caused area to drop below last season's level. Although the weather improved in May, the precipitation was too late for the earlier maturing crop and production fell to an estimated 0.5 million tons, down 65 percent from last year.

Italy's production is also forecast lower at 4.1 million tons, down 0.4 million from last season. Harvested area is forecast to increase slightly despite the continued domestic market depression and the elimination of the previous system of individual farm quotas. This system has been replaced by regional quotas with a total national ceiling of 1,646,000 hectares eligible for the supplementary compensatory payments (667,000 lire/hectares, or about \$385). Yield is not expected to reach the record high levels of 1998 due to lower input utilization resulting from reduced support for farmers. In addition, spring drought, hailstorms, and intensive rains during mid-June negatively impacted the yield and quality of the crop in Apulia (the most important durum producing region).

For France, the weather has been favorable throughout most of the season. Production is forecast at 1.6 million tons, up 5 percent from the 1998/99 crop due to higher area. Yield is

forecast at 5.00 tons per hectare, lower than last season's record level. Wet weather has delayed harvest activities. Total-yield for the EU-15 is forecast at the 5-year average of 2.43 tons per hectare.

Canada: Producers switched from planting durum to spring wheat this season, largely due to weak international prices. This season's forecast area of 1.9 million hectares is down nearly 1.0 million from 1998/99. Excessive rainfall in parts of Saskatchewan resulted in farmers being unable to fulfill their planting intentions. Approximately 80 percent of the durum wheat is grown in Saskatchewan. Variable weather since planting and spotty field conditions (caused by incomplete planting) has resulted in a national yield forecast near the 5-year average at 2.08 tons per hectare. Consequently, production of durum wheat is estimated at 3.9 million tons, down 2.2 million tons or 36 percent from the harvest of a year earlier.

Former Soviet Union: Russia and Kazakhstan are the primary producers of durum in the former Soviet Union. Neither State publishes durum area or production estimates; however, Russia's durum production is estimated at 1.6 million tons, up 14 percent from the last season's drought reduced crop. Hot, dry temperatures in the main durum growing area of the Volga Valley again negatively affected yield, but not to the extent of last year – yield is forecast up 13 percent from 1998/99. In Kazakhstan, durum production is estimated at 0.1 million tons, down 0.1 million from last season due to a decline in area. Practically all durum is produced by firms that have pasta production facilities and is not exported.

India: Durum production is forecast at 0.9 million tons, down 0.2 million or 15 percent from last year. Although there are no official estimates for durum wheat, reports indicate that durum area is reduced from the previous season due to low price realization and

marketing problems. Growing conditions were favorable this season. About 90 percent of the durum produced comes from Punjab and Madhya Pradesh with Gujarat also producing some minor quantities. Harvesting occurs during April and May.

Turkey: Durum output is estimated at 2.0 million tons, down 0.4 million or 17 percent from last year's record crop due to drought in the southeast. The Southeastern Anatolia Region produces about 50-60 percent of total durum wheat and some non-irrigated wheat areas in the Southeastern Region were badly affected by the drought this year. However, a significant amount of durum areas in the region were irrigated and, hence, were not affected. The remaining 40-50 percent durum is produced in Central Anatolia, around Ankara and Kayseri, which were not so much affected by drought. Harvested area is forecast at 1.0 million hectares, down slightly from last season due to the dry weather. However, farmers continued to plant durum in response to higher support prices versus other wheat. The 1999 support prices are lower than last season, but remain way above world market levels. The "sunni" insect, which regularly infests the crop, was much worse than previous years due in part to the dry weather. Durum wheat production is not broken out in Turkish official statistics and production is often not marketed.

Algeria: The durum crop is estimated at 1.2 million tons, down 0.4 million or 23 percent from last year's bumper crop. Harvested area is forecast at 1.3 million hectares, down 19 percent from 1998/99, but still a high level. Early-season rainfall was beneficial for planting, but late season dryness and heat diminished yield potential. Almost 70 percent of the total area sown to wheat is durum, which is primarily located in the eastern and central production areas.

Morocco: The durum output is estimated at

0.8 million tons, down 0.8 million or 52 percent from last season's record crop. Interestingly, over the last several years, Morocco has alternated between bumper and very poor harvests; this season's harvest obviously falls in the poor category. Durum area is forecast at 1.1 million hectares, slightly below last year. The late arrival of rains was followed by intermittent rainfall, but later in the season hot, dry weather severely reduced yield prospects. Roughly 40 percent of the wheat grown in Morocco is durum wheat and is grown mainly in the north.

Tunisia: Durum production is estimated at 1.1 million tons, virtually unchanged from the previous season's poor crop. A late start of the rainy season was followed by generally favorable weather, but a mid-season dry spell stressed the crops. However, beneficial rainfall during heading alleviated the moisture deficiency. Harvested area is forecast at 0.7

million hectares, up over 10 percent from last year. About three-fourths of all wheat grown is durum and production is centered in the northern regions.

Syria: Durum production is projected to be 1.5 million tons, down 1.1 million or 42 percent from 1998/99. Harvested area is forecast down nearly 20 percent from last year, with yields dropping 50 percent. Roughly 40 percent of the total-wheat area is grown on irrigated land; however, a severe drought throughout the entire growing season in the northeast durum region drastically cut the non-irrigated crop. About 60 percent of Syria's wheat is durum.

SPRINGFIELD, VA 22161

For questions or concerns on the data included in this publication,
contact us at the address shown above.

Summaries and selected tables from many Foreign Agricultural Service world market and trade reports are available electronically. The reports include U.S. Export Sales (available electronically after 8:30 a.m. on release day); Grain: World Markets and Trade; Oilseeds: World Markets and Trade; Cotton: World Markets and Trade; Tobacco: World Markets and Trade; World Agricultural Production; the early release version of World Horticultural Products and U.S. Export Opportunities; and Tropical Products: World Markets and Trade (all available electronically after 3:00 p.m. Washington DC time on release day) as well as Sugar: World Markets and Trade; Livestock and Poultry: World Markets and Trade; Dairy: World Markets and Trade, and U.S. Planting Seed Trade (available within a week after release.)

You can read the reports on the FAS home page (<http://www.fas.usda.gov>). The reports remain "current" until the succeeding issue is available. Older issues are available in the archives section of the home page. We also make selected cover articles and graphics available from these publications, in a separate section of the site. Reports are also available from the Economic Bulletin Board at Stat-USA, on the same schedule. For more information, you may contact Stat-USA at (202) 482-1986 (Monday-Friday, 8:30-5:30 p.m. Washington, DC time.)

For more information on the FAS home page, contact Glenn Kaup, tel. (202) 720-3329; fax. (202) 720-3229; or via e-mail kaup@fas.usda.gov

The U.S. Department of Agriculture (USDA) prohibits discrimination in its programs on the basis of race, color, national origin, gender, religion, age, disability, political beliefs, sexual orientation, and marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 14th and Independence Avenue, SW, Washington, DC 20250-9410 or call (202) 720-5964 (voice or TDD). USDA is an equal opportunity provider and employer."
